- The TEXT section contains assembly commands (eg ADD, SUB, ...)
- The DATA section contains global
- The HEAP is the place where dynamic allocated data is stored. (malloc)
- The HEAP is also used to map libraries, files or devices into the address space
 - The stack is the place for function calls
 - Almost everything is predictable

 - Most CPUs have a NOP instruction (no operation): the instruction does nothing but increasing the Instruction Pointer by one.
 - We insert shellcode that, most of the time, opens a (root) shell.
 - Finally we set the RA (Return Address) back to a NOP instruction (guess the jump distance).

Conclusion

System and kernel security

- The foundation of the Android platform is the Linux kernel.
- The Linux kernel provides Android with several key security features, including:
 - User-based permission model
 - Process isolation
 - Extensible mechanism for secure IPC
 - The ability to remove unnecessary and potentially insecure parts of the kernel

- Protecting computer systems from crackers is difficult
- People have found ways to get around all those security features we presented, especially in isolation
- Nevertheless, it's much harder to break into a computer system with all those fancy security features
- It's difficult to find a good path between all those conflicting goals: comfort, security, performance, clean and simple implementation...
